

Practical Assignment 3

Sr. No	Practical Question	Type
1	Write a program that takes an integer input from the user. Use an if-else statement to check if the number is even or odd, and print an appropriate message.	Easy
2	Create a variable temperature = 28. Write an if-elif-else ladder to print "Cold" if the temperature is below 15, "Warm" if it's between 15 and 30 (inclusive), and "Hot" if it's above 30.	Easy
3	Write a program using a for loop to print the first 10 positive integers (from 1 to 10) on separate lines.	Easy
4	Initialize a variable count = 5. Use a while loop to count down from 5 to 1, printing each number, and then print "Blast off!" after the loop ends.	Easy
5	Write a for loop that iterates through numbers from 1 to 10. Use an if statement inside the loop with the continue keyword to skip printing the number 5.	Easy
6	Write a program that asks the user to input their exam score (0 to 100). Use nested if-else statements to first check if the score is valid (between 0 and 100). If valid, check if it is 50 or above to print "Pass", otherwise print "Fail".	Moderate

7	Use a for loop to calculate and print the sum of all even numbers between 1 and 20 (inclusive).	Moderate
8	Create an infinite while True loop that continuously asks the user to type a word. If the user types the word "exit", use the break statement to stop the loop.	Moderate
9	Write a program that uses a loop to print the multiplication table of a number entered by the user (up to 10). (e.g., if input is 3, print $3 \times 1 = 3$, $3 \times 2 = 6$...)	Moderate
10	Setup a structure for a future feature: Write an if-else statement checking if is_admin = True. If they are admin, use the pass statement as a placeholder for future code, otherwise print "Access Denied".	Moderate
11	A user is trying to log into their bank account. Write a while loop that gives the user exactly 3 attempts to input the correct 4-digit PIN (e.g., 1234). If they get it right, print "Access Granted" and break. If they fail 3 times, print "Account Locked".	Thinking-Based
12	Write a program that iterates through numbers from 1 to 15. For multiples of 3, print "Fizz" instead of the number. For multiples of 5, print "Buzz". For numbers that are multiples of both 3 and 5, print "FizzBuzz". Otherwise, just print the number.	Thinking-Based

13	A cinema charges different ticket prices based on age and day of the week. Take age and is_weekend (Boolean) as inputs. If it's a weekday: under 12 pays 150, adults pay 300. If it's the weekend, add a 50 rupee surcharge to both categories. Use nested conditions to calculate and print the final price.	Thinking-Based
14	A digital shopping cart has an items limit. Write a while loop that simulates adding items to a cart one by one. Ask the user if they want to add another item (y/n). The loop should stop if the user types n OR if the total items reach a maximum capacity of 5 items. Print the total items in the cart at the end.	Thinking-Based
15	Take an integer input greater than 1 from the user. Use a loop and a boolean flag variable to check if the number has any divisors other than 1 and itself. Print "Prime Number" or "Not a Prime Number" based on your findings.	Thinking-Based
